## Abstract

Illicit drug abuse is now a major public health issue. In society, some people use drugs abuse. It is no secret that it is already very prevalent, especially among young people. Young people are turning to illegal drugs for a variety of reasons, and a number of different drugs are currently in use. Among them is the rapid spread of the illicit drug methamphetamine, or ice, which is seen as one of the most harmful of these drugs. It has already been found that there is a high prevalence of high addiction among young students in schools and higher education, as well as among various youth groups in other societies. Various organizations have pointed out that this has had a negative impact on Student's health and education. It's just as short-lived, it's long-lasting. A number of studies have already been conducted using a variety of techniques for this purpose, both successful and unsuccessful. In the world of picture data, convolutional neural network models are everywhere. They excel in computer vision tasks like as picture categorization, object identification, and image recognition, among others. In this study, discussed about the illicit drug, specifically as an ice or methamphetamine drug, and a proposal is made for a algorithm using convolutional neural network that can be used as an alternative. This suggested modal will be develop, specifically for younger's in order to detect their abuse, enhance their health, and gain more benefits. This study, using CNN technology, a widely used in-depth learning technology for solving image classification challenges, using long and short term changes in appearance based on evolutionary algorithms, Identify whether ice drugs have been used by people not included in the database, as drug users have pointed out above.

---

## **Acknowledgment**

I would first like to express my sincere gratitude to my supervisor Dr. Anuradha Jayakody who made this work possible. His guidance, patience, and support carried me through all the stages during my research project. Throughout the learning process of this master's research project, he continually mentored me with helpful comments, remarks and engagement, without which I would not have been able to write my master's thesis.

Next, I would like to thank MSc Coordinator (IT) / Senior Lecturer Mr. Samantha Rajapaksha and the lecturers who have lectured and assisted in various ways at the Sri Lanka Institute of Information Technology. I would also like to thank my friends for their valuable suggestions and ideas.

I would also like to give special thanks to my entire family for their unwavering support and understanding during my research and writing process. Your prayers for me have kept me going thus far.

Last but not least, I want to express my gratitude to God for allowing me to persevere in the face of adversity. I have experienced your guidance day by day. You are the one who allowed me to complete my degree. I will continue to put my faith in you for my future.

## List of Abbreviations

CNN	Convolutional Neural Network
GPU	Graphics Processing Unit
PCA	Principle Component Analysis
ReLU	Rectified Linear Unit
SVM	Support Vector Machines
VGG	Visual Geometry Group
AUC	Area under the Curve
ROC	Receiver Operator Characteristic
TPR	True Positive rate
FPR	False Positive rate
ASD	Autism Spectrum Disorder
GAN	Generative Adversarial Network
METH	Methamphetamine
DAD	Drug abuse detection
DNN	Deep Neural Network
ILSVRC	ImageNet LargeScale Visual Recognition Challenge
LBP	Local binary patterns
SNP	Single nucleotide polymorphism
LDA	Linear Discriminate Analysis
